# Semantic UI

### Semantic UI

http://semantic-ui.com/

#### SEMANTIC

```
<main class="ui three column grid">
    <aside class="column">1</aside>
    <section class="column">2</section>
    <section class="column">3</section>
    </main>
```

#### SEMANTIC

```
<nav class="ui menu">
  <h3 class="header item">Title</h3>
  <a class="active item">Home</a>
  <a class="item">Link</a>
  <a class="item">Link</a>
  <a class="right floated text item">
        Signed in as <a href="#">user</a>
  </span>
</nav>
```

#### SEMANTIC

```
<button class="large ui button">
    <i class="heart icon"></i>

</button>
```

### **Defining Definitions**

Definitions in semantic are groups of css, fonts, images, and javascript which make up a single element. Unlike other javascript libraries, semantic UI elements are stand-alone and only require their own assets to function correctly.

### **Definition Types**

Semantic has five different ui definitions. These are useful patterns for describing re-usable parts of a website.

UI Element	A basic building block of a website, exists alone or in homogenous groups
UI Collection	A heterogeneous group of several elements which can usually be found together.
UI View	A way to present common website content like comments, activity feeds
UI Module	An element where its behavior is an essential part of its definition
UI Behavior	A set of free-standing actions not specifically tied to an element

### **Definition Sections**

All UI components of a single type are defined similarly

	<b>Types</b> Defines mutually exclusive types which each may have their own html
All UI	States Defines element states like disabled, hovered, pressed down
	Variations  Defines changes to an element which are not mutually exclusive and can be used together

# Elements & Collections

Elements	Group An element can optionally define how attributes can be shared across a group
	Ul Button
Collections	Content A collection can define elements which might be found inside
	States A collection may define states for content elements or itself
	Variations A collection may define variations for content elements or itself
	UI Form

# Views, Modules & Behaviours

	UI Dropdown
Examples	<b>Examples</b> A list of examples to showcase the variations in behavior of a module
Modules & Behaviors	Settings A settings object which can alter the default behavior when instantiating a module
	<b>Behavior</b> A module will define a set of behaviors which can be used as an API
	Ul Item
	Variations A view may define variations for a content elements or itself
Views	States A view may define states for content elements or itself
	Content A view may define elements which can exist inside of the view

#### Breadcrumb

A breadcrumb is a menu to show the location of the current section in relation to other sections.

# We're sorry we can't process your idea just yet

Please enter your name

#### Message

Messages alert a user to something important.

Name	Status
John	Approved
John	Unconfirmed
Sally	Denied

#### Table

A table collects related data into rows of content

### Modules

**Overview** Initializing Behaviors Settings

All official javascript modules in Semantic are designed using a singular design pattern. This pattern allows several useful features common to all javascript components

#### ✓ Run-time Performance Analysis

Semantic modules all provide the ability to log performance traces to the console, allowing you to see which aspects of the module are more or less performant and to track total init time on DomReady

#### ✓ Human Readable Traces

Unlike other component libraries which hides explanations of behavior in inline comments which can only be read by combing the source, semantic modules provide run-time debug output to the javascript console telling you what each component is doing as it is doing it.

#### Settings can be overwritten after initialization

Semantic provides methods to set default settings, set settings at initialization, and set settings after initialization, allowing complete flexibility over component behaviors.

#### All modules include an initialize and destroy method

All events and metadata are namespaced and can be removed after initialization, modules automatically handle destroy/init events to allow users to lazy-initialize a plugin multiple times with no issues.

#### ✓ Instance available in metadata

Modules store their instance in metadata meaning that, in a pinch, you can directly modify the instance of a UI element by modifying its properties.

# Interfacing Carefully

- UI definitions in Semantic are given the class name ui.
- This is to help tell the difference between ui elements and parts of the definition of an element.
- This means any element with the class name UI has a corresponding UI definition.

# Changing an Element

- Class names in Semantic always use single english words.
- If a class name is an adjective it is either a type of element or variation of an element.
- CSS definitions always define adjectives in the context of a noun. In this way class names cannot pollute the namespace.

# Combining an Element

- All UI definitions in semantic are stand-alone, and do not require other components to function.
- However, components can choose to have optional couplings with other components.
- For example you might want to include a badge inside a menu. A label inside of a menu will automatically function as a badge

```
USING A UI LABEL INSIDE A UI MENU
                                        HTML
<div class="ui compact menu">
  <a class="item">Home</a>
  <a class="item">
    Inbox
    <div class="ui label">22</div>
  </a>
</div>
         Inbox 22
Home
```

# Types / Variations

- A ui definition in Semantic usually contains a list of mutually exclusive variations on an element design.
- A type is designated by an additional class name on a UI element

```
TYPES OF UI BUTTON
                                                         HTML
<div class="ui labeled icon button">
  Download <i class="download icon"></i>
</div>
<div class="ui icon button">
  <i class="download icon"></i></i>
</div>
<div class="ui button">
  Download
</div>
<div class="ui facebook button">
  <i class="facebook icon"></i></i>
  Facebook
</div>
     DOWNLOAD
                                                 FACEBOOK
                     (
                            DOWNLOAD
```

# Types / Content

- Types may require different html structures to work correctly.
- For example, an icon menu might expect different content like icons glyphs instead of text to be formatted correctly

```
ICON MENU TYPE
                                                           HTML
<div class="ui icon menu">
  <a class="item">
    <i class="mail icon"></i>
  </a>
  <a class="item">
    <i class="lab icon"></i></i>
  </a>
  <a class="item">
    <i class="star icon"></i>
  </a>
</div>
```

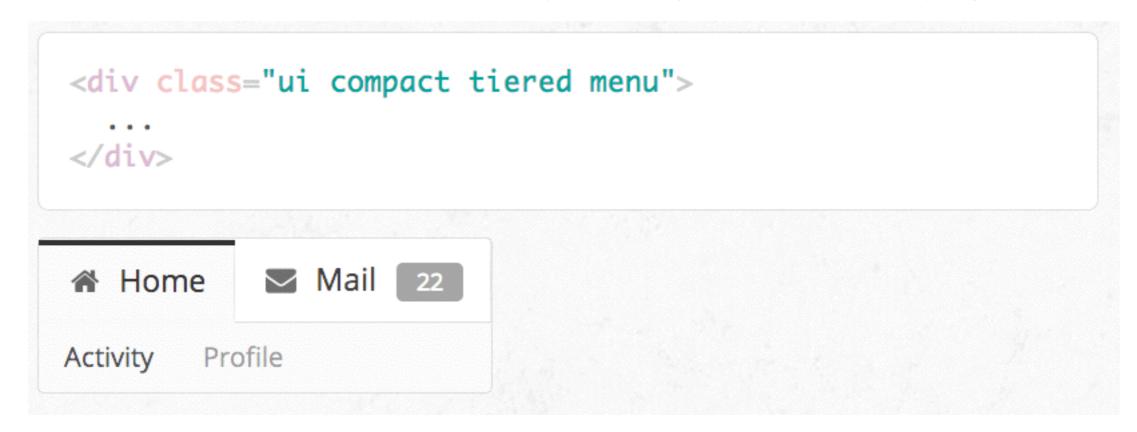

### Types / HTML Differences

- Types may also each require slightly different html.
- For example, a tiered menu needs html specified for a sub menu to display itself correctly

```
TIERED MENU TYPE
                                                         HTML
<div class="ui tiered menu">
  <div class="menu">
    <div class="active item">
      <i class="home icon"></i></i>
      Home
    </div>
    <a class="item">
      <i class="mail icon"></i></i>
      Mail
      <span class="ui label">22</span>
    </a>
  </div>
  <div class="sub menu">
    <div class="active item">Activity</div>
    <a class="item">Profile</a>
  </div>
</div>
            ✓ Mail 22
Activity
        Profile
```

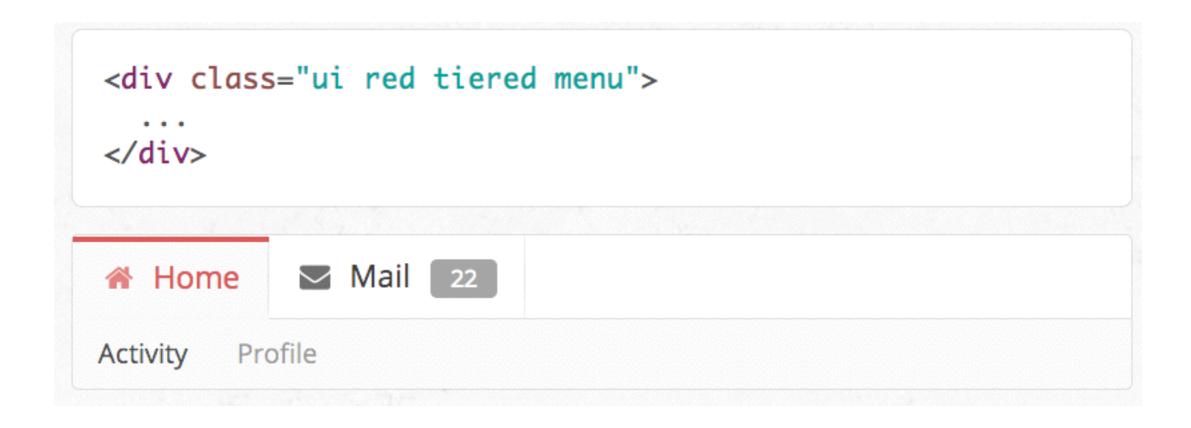

### **Variations**

- A variation alters the design of an element but is not mutually exclusive.
- Variations can be stacked together, or be used along with altering an element's type.
- For example, having wide menus that take up the full width of its parent may sometimes be overwhelming. You can use the compact variation of a menu to alter its format to only take up the necessary space.

# Intersecting Variations

 The definition for the variation red contains css specifically for describing the intersection of both red and inverted.

# Whats Different?

# Build Responsive Layouts Easier

- Designed Completely with EM
- Every component is defined using em and rem so that components can be resized simply on the fly.
- Want a menu to get smaller on mobile? Simply have it's font-size change using a media query.

# Self Explanatory

- Descriptive not Prescriptive
- Writing front end code shouldn't require learning the naming or programming conventions of a particular developer.
- Instead of using short-hand, or codifying naming conventions, Semantic uses simple, common language for parts of interface elements, and familiar patterns found in natural languages for describing elements.

# Tag ambivalent

- Use whatever html tags you please.
- Interface definitions in Semantic are tag ambivalent.
- That means you can use div, article, section, span without affecting the display of the element.
- Special tags like a, table, td still carry special meaning in certain circumstances however.

# Powerful tools for expressing groups and collections.

- Don't repeat yourself
- In English it's much easier to say "There are three tall men" than "There is a tall man, a tall man and a tall man".
- In Semantic element definitions can be expressed in groups have shared attributes like size, color, type avoiding repetitive declarations.

### Portable and self-contained.

- Using Semantic doesn't mean adopting an entire framework, or rewriting your code base
- Semantic components are written in a singular style, but are not part of mandated overarching library. Only like a couple components? No problem, use only what you need.
- UI components in Semantic also define optional and required couplings with other components where their usage intersect. That means for example, a popup can check for the existence of CSS animation component before using the fallback javascript animations.

### Shared language, different implementations

- Restyle your site without Restructuring it
- Describing your site's content using a common language like Semantic allows other developers to create UI definitions to match one shared vocabulary.
- This means you can redesign your website without retooling your html.
- Simply alter the look and feel of your UI using a different UI style definition.
